

ABSTRACT

A multiple socket having rotatable receptacles includes a plurality of sets of receptacles at a housing of the multiple socket, and a first conducting strap and a second conducting strap at an interior of the housing. At positions corresponding to positions of the receptacles, the first conducting strap and the second conducting strap are provided with clamping portions for inserting with pins of plugs. At least one set of receptacles is disposed at the housing in a rotatable manner, and the receptacles are provided with insertion openings at positions corresponding to the clamping portions. When the receptacles rotate pivotally, the insertion openings are rotated regard the clamping portions as rotation axes thereof, such that regardless of directions of the receptacles pivotally rotated, the pins of the plugs are penetrated in these specific directions through the insertion openings to come into contact with the clamping portions.
